

Nova SPY Digital

ROBUST, COMPACT & METROLOGY MADE EASY

New generation of 2.4GHz recorders for JRI digital probes.

Monitoring temperature-sensitive products & processes.

The device transmits the measured data to a nearby **LINK** or **RELAY** module, via 2.4 GHz radio frequency. Measurements are then automatically sent to the secure **JRI Cloud** to be hosted and processed on the **JRI-MySirius** web application.

The Nova SPY Digital measures and records temperature and humidity according to the digital probe connected to it. Digital probes have an **internal memory** that stores calibration coefficients.

This means that calibration can be carried out in the laboratory or by simply exchanging probes, without interrupting product monitoring.

Binder connection
IP68 for JRI digital probe

THE BENEFITS OF NOVA SPY DIGITAL

3-in-1

Temperature via sensor
Door opening detection
Simulated core temperature

Easy to install
and use

Eco Conception

Made in France
Long device life

Small & Sturdy
Highly resistant to shock and
vibration

Automatic detection
in the JRI-MySirius
application

Alert detection
Local warnings (light & buzzer)
Remote notifications

Monitoring solution for temperature-sensitive products and processes with JRI-MySirius

INSTALL

The Nova SPY Digital connected sensor **measures and records** temperature.

Small and robust, it is designed to monitor the temperature inside your enclosures.

CONNECT

The device transmits measured data via a nearby **LINK** or **RELAY** module to the JRI-MySirius platform.

EXPLOIT

Measurements are saved in the cloud and can be **viewed on the JRI-MySirius platform**.

It enables you to supervise and manage all your sensors, **customize your dashboard** with different indicators, set your alerts, etc.
